

Madison Modern

Social

Maaha Saeed, Nicole Filatova, Ben Solimini, Adharsh Krishnan, Brendan Carew

OUR COMPANY

- **Location** : Old Bridge, NJ
- **Primary contact:** Maria Ramoundos, Head Manager
- Conducted two in-depth interviews with Maria and one employee interview via Phone Call
- Gained permission to distribute anonymous surveys to 3 managers and 12 hostesses

BRIEF HISTORY...

- Opened in 2025 as a new upscale dining concept designed to blend restaurant, lounge, and nightlife trends
- Founded by Frank Brusco, Kosta Rexinis, and Demetri Rexinis
- Owners previously co-owned Over Easy Kitchen went on to open Madison Modern Social

Output Problem

The primary output problem is a **dissatisfaction within hostesses** over **when their shifts should end** .

- Managers keep hostesses on the clock longer as a precaution in case there are unexpected phone calls, a sudden influx of guests, or additional tasks that need to be completed
- Hostesses feel as though they stay longer than necessarily needed with no explanation

Data Collection

Method

Two anonymous surveys- hosts and managers

The surveys will measure perspectives of:

- **Fairness and communication**
- **Satisfaction** with cut times
- **Predictability** of cut times
- **Agreeance** to possible **solutions**
- **Productiveness** when nearing the end of the shift

Summary of Interview Data

Central Findings From Interviews:

Core issue: ongoing **dissatisfaction & confusion** around hostess cut times

Managers keep hosts later to **protect service quality**

Hosts view system as **arbitrary, inconsistent, and demotivating**

Key problem : unclear expectations + inconsistent communication → perceived unfairness

MADISON
MODERN SOCIAL

To conclude, through extensive research we found that the problem is not operational capacity; it is an issue of role clarity, expectation-setting, and transparent communication that ultimately creates a systemic failure in perceived fairness.

Course Concept: *Interactional Organizational Justice*

Why This Concept *Directly Applies*

-> Interactional justice addresses the **quality of interpersonal treatment** ,

-> Informational justice specifically addresses:

- how well decisions are explained,
- whether rationales are transparent,
- whether employees feel adequately informed about policies and expectations.

Addressing informational justice improves:

- perceived fairness, employee trust in management,
- consistency in expectation-setting, and
- overall morale and organizational commitment.

Application to Madison Modern Social

- Hosts' dissatisfaction stems from lack of communicated logic behind cut-time decisions.
- Managers believe communication is adequate, while hosts experience the opposite thus indicating an a failure in clear communication
- Absence of a codified standard (ex; criteria based on reservations, covers, or remaining guests) prevents hosts from perceiving decisions as predictable, equitable, or justified.

Method for Quantifying the Severity of the Output Problem

We chose to use **surveys** with hostesses and managers to quantify the output problem, utilizing numerical scales/number ranges to measure dissatisfaction.

Metrics

- **Scales** (ex: “On a scale of 1-5...”)
 - Measured how dissatisfied the hostesses are by seeing the percentage of hosts who rate their dissatisfaction as a 4 or 5
- **Number ranges**
 - Measured average amount of time hostesses spent being unproductive (ex: “Per shift, I spent 10-20 mins/20-30 mins/30-40 mins, etc...”)

Reasoning

- Scales and numerical ranges allow us to find **averages** to compare between hostesses and management
 - Exposes **communication gaps** by showing differences between perceptions
- Furthermore, **high dissatisfaction rate** can show objectively that hostesses don't work well with this system

Quantifying and Contextualizing the Severity of the Output Problem

How much did managers and hostesses agree that they are satisfied with the time that hostesses are let out?

Hostesses

- Statement: “I am satisfied with the time I leave my shifts”
- Scale: 1-5
- Average: **2.33**

Managers

- Statement: “I am satisfied with the time the hosts leave their shifts”
- Scale: 1-5
- Average: **4.33**

Severity

- Difference between averages is **2.0**
- Hostesses are dissatisfied, managers believe cut times are appropriate
- Shows gap in understanding, prevents managers from recognizing problem.

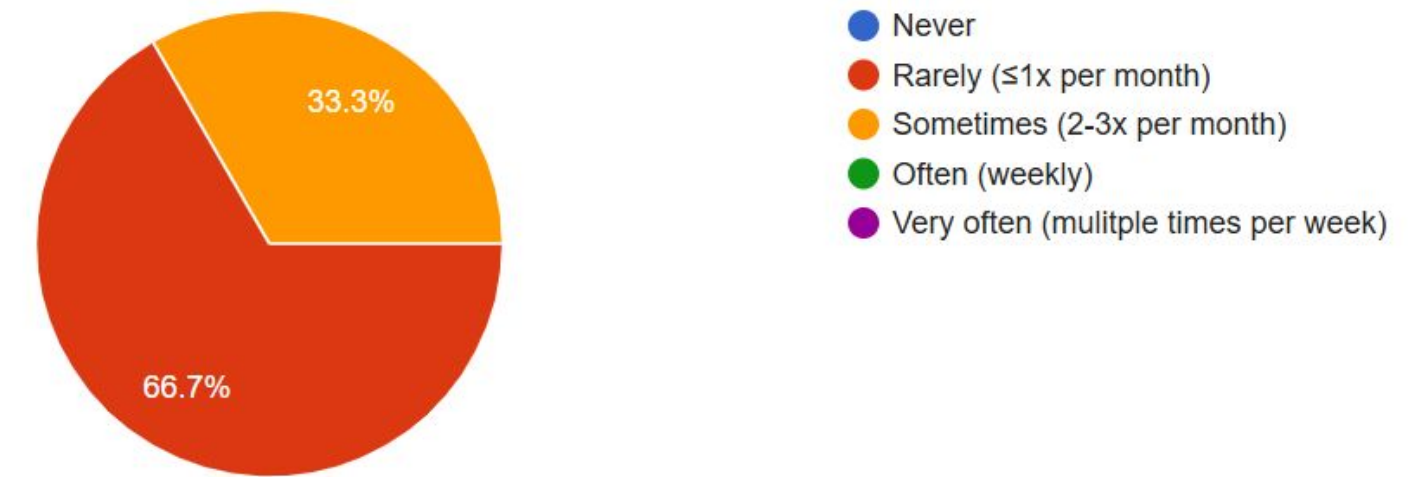

Recommendations

- ❑ Creation of a cheat sheet
- ❑ Guidelines clearly established
- ❑ Usage along with weekly reservation schedule will set expectations for shifts

9. If a fixed rule were adopted, I would need to override it:

3 responses

7. If there were a clear standard (e.g., "hosts can leave X minutes after the last guest exits"), I would view cut times as fair.
